

Lightning Network Reliability: Mesh vs. Hub (Fig. 6)

The right panel is NOT a like-for-like re-measurement of the left panel: it reports one large, well-connected custodial node's own platform success rate, not decentralized mesh-wide reachability. The gap between the two is the predicted signature of the hub-and-spoke centralization formalized by Avarikioti et al. (2020) -- reliability gains arrived via centralization, not via a more reliable decentralized mesh. Sources: Waugh & Holz (2020); River Financial (2023).
