

Bitcoin vs. S&P 500: Raw Correlation vs. Macro-Liquidity-Controlled (Fig. 11)

*NEW IN v5: the dashed blue line nets out each 60-day window's linear co-movement with the Dollar Index (UUP) and the VIX before computing the Bitcoin-S&P 500 correlation, directly testing whether the raw DCC-GARCH correlation spike during 2020/2022 stress periods is a shared macro-liquidity artifact or survives the confound. Where the dashed line stays well below the solid red line during stress windows, the macro-confound critique has merit; where it does not, the 'Bitcoin behaves like risk-on tech' reading survives it.*
