

Transaction Throughput by Settlement Layer (Fig. 2)

Fedwire TPS uses the Fed's own 2024 PFMI disclosure (836,322 avg. daily transactions). T2's exact 2024 transaction count is not cleanly published; shown here as an order-of-magnitude RANGE with that uncertainty disclosed, not a false-precision point estimate. This figure supports the Pillar I argument that Bitcoin L1 is throughput-adequate for a settlement layer and throughput-inadequate for a retail network -- not that either comparison alone is dispositive (§3).
