

Bitcoin Mining Pool Concentration, 2025-2026 (Fig. 6)

Stratum V2: ~75% of hashrate joined the working group (May 2026); only ~3-5% runs it in production. Mitigates pool-level censorship specifically -- does NOT reduce hashrate concentration or reorg risk.

REPRODUCED AS A RANGE across independent trackers (Hashrate Index; B10C, 2025; Spark, 2026), since single-point estimates for this metric swing by several points week to week and no single tracker should be presented as definitive. The same super-additive-coalition-value logic that predicts Lightning hub formation (Fig. 3) predicts this concentration (Leonardos et al., 2019) -- \$5.
