

Bitcoin vs. S&P 500: Raw vs. Macro-Liquidity-Controlled DCC-GARCH (Fig. A5)

*The dashed blue line applies the IDENTICAL DCC-GARCH(1,1) estimator as the solid red line, but to Bitcoin and S&P 500 returns each first residualized (static OLS) against the Dollar Index (UUP) and the VIX. Both lines therefore use the same econometric estimator; only the input series differ. This panel is restricted to the common TradFi trading-day calendar, disclosed here since Bitcoin's other statistics in this appendix use its native 365-day calendar. Supplementary context; not part of the re-intermediation argument.*
