

51% Attack Economics: Harvey's Own Revision (Fig. C1)

Static Hardware/Infrastructure Cost
(Harvey, Oct 2025)

The Estimate Moved Up, Not Down,
Once a Profit Motive Was Added

REPRODUCED FROM CITED SOURCES: Harvey (Oct. 2025) estimated ~\$6B in static hardware/infrastructure cost for a one-week attack. Harvey's own July 2026 update raises this to ~\$8B, adding a derivatives-shorting profit mechanism. Both estimates should be read as bounds on a moving target. Supplementary detail for the Pillar III security-budget argument (\$5); the core structural claim does not depend on the specific dollar figure.
